VeriWise™

How it Works

Using a remote monitoring device, satellite-based telecommunications, a series of sensors and established business rules, GE's VeriWise technology gathers and provides information on the location of the fleet and the status of the cargo inside each trailer. The tracking solution was developed through in-depth customer research as well as GE's extensive equipment monitoring knowledge.

Geo-fencing

"Virtual fences" or geo-fences can be set-up around an address. When a trailer crosses the fence a "geo-fence entered" or "geo-fence exited" message is generated that provides location, date, and time. Using the Premier Services™ web interface, users can create, modify, assign, and delete geo-fences from their computer system. Alerts can be set to notify key people of geo-fence entered/exited activity.

Proximity Search

Landmarks give VeriWise™ users the ability to name an address so it can be easily recognized on the Web site. Proximity searches help users find trailers within a user defined radius around a landmark or specified address. Using the Premier Services™ web interface, users can create, modify, and delete landmarks from their computer system.

Emergency tracking

This feature is ideal for a variety of uses, including locating a certain trailer, keeping a close eye on high value/high security loads, or monitoring if a unit is reported stolen. Using the Premier Services™ web interface, users can turn on rapid reporting of the trailer's location—whereby a trailer is polled at specific time intervals for a defined period of time.

Making VeriWise™ Work for You
